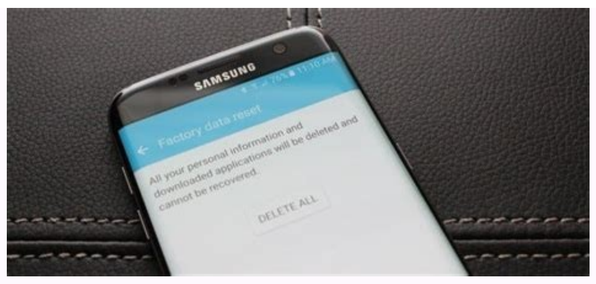
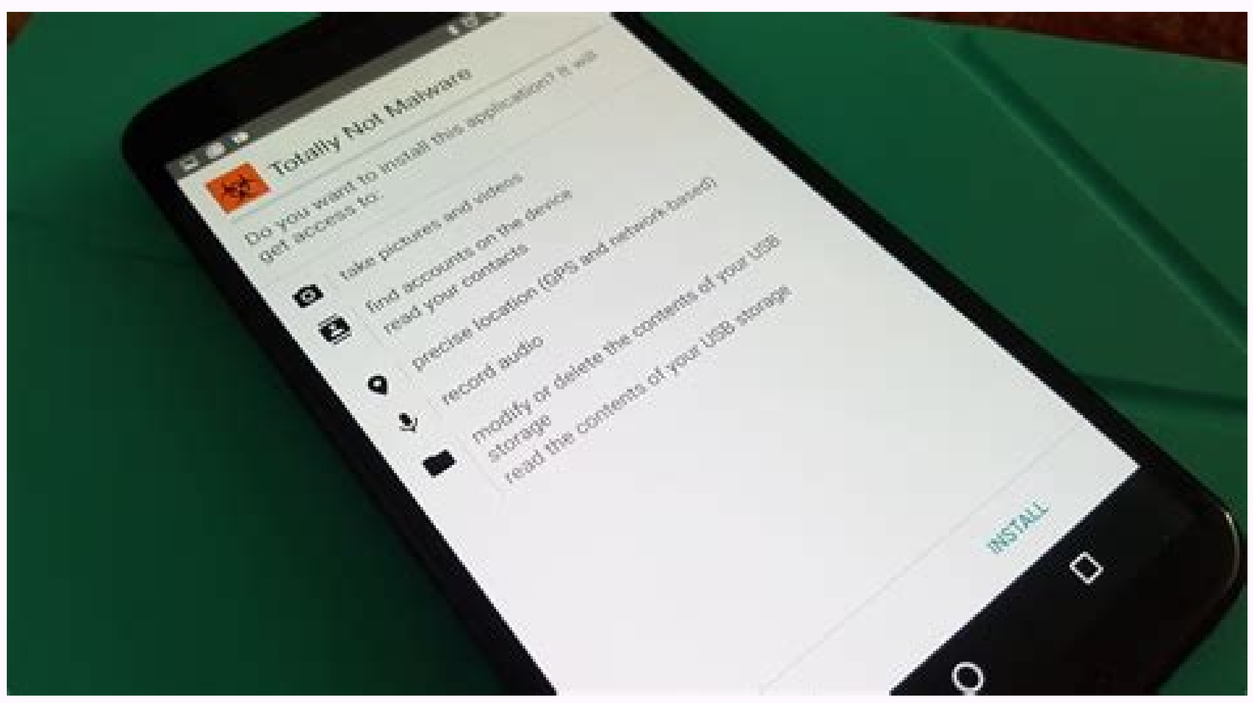
RESET PHONE





Delete factory apps on android. How to remove unwanted apps from android phone. Does factory reset remove apps from android. How to remove factory installed apps from android. How to remove factory apps from android phone.

Even the best phones come with malware and pre-installed apps that take up valuable storage space. Here's how to remove them and speed up your device. To view this article again, go to My Profile and then View Saved Stories. Medium: These are apps pre-installed on your smartphone that you definitely didn't ask for and probably don't want. Manufacturers often use them to promote their own apps and services in addition to (or instead of) what the smartphone offers as standard. The term was originally used to refer to Windows computers, which may have a long list of third-party tools and software packages on top of Windows itself, depending on who you purchased the computer from. Things have improved in recent years, but even today you can open up a new Windows laptop and run trial versions of half a dozen different applications, utilities, antivirus programs, and office tools. they don't actually do anything harmful, these unwanted apps take up disk space and system resources that can be used by apps you actually want to use. They can also be confusing because there are several apps on your phone that do the same job. For security and privacy reasons, it is recommended to remove malicious apps that you do not use. How you do this depends on the phone you're using. Software bloat is a much more common problem on Android phones because so many phone manufacturers release Android devices. In some cases, you may end up with a dozen or more apps that you don't really need or want (although the manufacturers themselves will be interested in you trying them out). To remove an app, malware, or anything else from your Android phone, open Settings and select Apps & notifications, then Show all apps. When you're sure you can live without something, choose an appEven the best phones have pre-installed apps that take up valuable disk space. Here's how to remove them and speed up your device. To read this article, go to "My Profile" and then to "View Saved Stories". To read this article, go to My Profile and then to View Saved Stories. Bloatware doesn't sound great, but it's a pretty simple situation: Your smartphone comes preloaded with apps that you definitely didn't ask for and probably don't want. Manufacturers often use them to add their own apps and services in addition to (or instead of) what a smartphone offers by default. The term was originally used to refer to Windows computers, which can have a long list of third-party tools and software packages in addition to Windows itself, depending on who you purchased the computer from. The situation has improved in recent years, but even today you can open a brand new Windows laptop and find trial versions of half a dozen different applications, utilities, antivirus and office tools. While most malware doesn't actually cause harm, these unwanted applications take up disk space and system resources that can be used by the programs you really want to use. They can also be confusing, leaving multiple apps on your phone doing the same job. For security and privacy reasons, it is recommended to remove unused malicious applications. How you do this will depend on the phone you are using. Bloated software is a much more common problem on Android phones because many phone manufacturers release Android devices. In some cases, you may find that you have a dozen or more apps that you don't really need or want (even if the manufacturers themselves want you to try them). To get rid of any app in your android phone. , malware, or something, open Settings and select Apps & notifications, then Show all apps. If you're sure you can do without something, choose an appSelect "Delete" to remove it. In some cases, the app cannot be completely uninstalled because the manufacturer integrates it into their version of Android. If that's the case, look for an option that says "Disable" rather than "Uninstall" — at least this will prevent the app from running, using critical system resources, and causing disruption. Apps can be uninstalled or disabled in settings. David Neild via Google. The process may vary slightly depending on the make and model of your phone and the version of Android you are using. However, if you go to the main Settings app, you should be able to uninstall or disable apps pretty easily on your phone, which is a bit smaller and loaded with unnecessary junk. As mentioned, some Android phone manufacturers pre-install apps that cannot be uninstalled in the normal way. If you want to completely uninstall apps instead of disabling them, or you're dealing with malware that can't even be disabled, you have some more difficult and complicated options. The first is to install the Android Studio developer tool on your Windows or macOS computer - downloads can be found on this page. You'll also need to enable developer mode on your phone, which you can do by going to About phone in Settings and tapping Build Number seven times. In the "System" section of the settings, a new "Developer options" menu will open, where you should enable USB debugging. (There's nothing wrong with that, but it opens up a number of new possibilities that should be used with caution when experimenting.) Now you can connect your phone to your computer via USB and get to work. . Once a physical connection is established, you need to open a PowerShell (Windows) or Terminal (macOS) window from the Android Studio folder where the Android Debugging Bridge (ADB) is installed - on Windows you need to go to the C:\Users folder. \ \ AppData\ Local\ Android\ Sdk\ platform-tools (where "" is your Windows user account name),inside the folder and select Open PowerShell Window here. In an open PowerShell or terminal window, run ".\adb devices" to initialize the link and then "adb shell" to take control of the connected Android device (on Mac they don't need the preceding ".\"). The last command you need is "pm uninstall -k --user 0 " where " is the package name of the app you want to get rid of: you can use the free app inspector on your phone . To find these names, you can uninstall multiple apps using Android Studio on your PC. David Neild via Microsoft This is a quick guide to this rather complex and technical process. If you're serious enough about removing malware this way, we recommend that you first read the details about your specific phone model and learn more about ADB, as well as check out XDA Developers' excellent guide on the process (you can also find phone-specific guides) .The second way to completely remove malware is to root your phone. As with ADB, this requires some technical knowledge, but it will also void your phone's warranty and bring a (less) risk of your device being locked out. very hard some unwanted apps but the option is there if you need it. If you think rooting is right for you, it will give you complete control over your phone and its software. Again, XDA developers have a detailed and comprehensive guide for all types of Android phones, and after setting up your phone like this, you will be able to use apps like Root App Deleter or System App Remover to get rid of these unwanted apps. You can remove stock iOS apps, but some data may remain in iCloud. David Neild through the Apple iPhone has a much smaller virus problem because only Apple does it (yes, the iPhone and all the pre-installed apps that come with it). You might argue that some of Apple's lesser-needed apps fit the definition of malware, but you certainly do.Get all the largely unnecessary third-party apps you didn't expect beforehand has made it possible for users to uninstall many default apps when they don't need them. Apps you can get rid of include Calculator, Calendar, Compass, Contacts, FaceTime, Home, iBooks, iCloud Drive, iTunes Store, Mail, Maps, Music, Messages, Notes, Podcasts, Reminders, Actions, Tips, Videos, Voice notes, clock and weather. To uninstall one of these apps, follow the same procedure as uninstalling a third-party app: press and hold the icon and choose Uninstall App from the menu that appears. Then you will see a confirmation window. So click "Erase" to complete the process. If you need any of these apps again in the future, you can find them in the App Store. In some cases, deleting an app does not remove related features that are actually built into iOS itself. For example, remove FaceTime and you can still make and receive FaceTime calls from the Phone app. The Phone app also retains your contact list even if you uninstall the current Contacts app. You can uninstall apps that you have installed on your phone. If you delete a paid app, you can reinstall it later without buying it again. You can also disable system apps that come with your phone. Uninstalling installed apps Open the Google Play Store app. Tap the profile icon in the top right corner. Tap Manage Apps & Devices. Click on the name of the application you want to remove. Click Remove. Disabling apps installed on your phone Some system apps that were preinstalled on your Android phone cannot be removed. However, some phones allow you to turn them off so they don't show up in your phone's app drawer. To learn how to disable apps, contact your device manufacturer. Apps you don't use If you haven't used apps in a while, Android optimizes them in the following ways: Frees up disk space by deleting temporary files Removes app permissionsapps that don't run in the background and don't send notifications. You can go to AppsUnused apps to view unused and optimized apps. To exclude a specific app from this feature, go to the App Details section. Unused applications. Close apps when you're not using them, then turn this feature off. Related Resources Most Android smartphone manufacturers pre-install some of their exclusive apps on their smartphones at launch, and many of these pre-installed Android apps are often blocked by the device manufacturer to prevent users from removing them from their device. While some pre-installed apps like file managers or gallery apps are really useful, not everyone wants to accidentally download an app on their phone that they never use, that just sits and runs in the background, which can slow down their phone or even kill it. . battery life. Even Google smartphones that come with stock Android, which is essentially the purest version of Android, come with malware or junk apps like Google Play Movies or Google Play Books that most users probably don't use. So, if you are looking for a way to permanently uninstall or remove pre-installed apps and malware from your Android device to increase its performance or battery life, here are some ways to remove pre-installed apps and malware from Android. . Disabling apps While this method is the easiest on the list and doesn't require root access, it simply disables the app instead of uninstalling it and removing it from your phone completely. This means that the app will not run in the background and will not appear in the list of installed apps on your device or in the list of updates in the Play Store. However, it will still be available on your device and you can undo the action and allow the app to use it if you change your mind in the future. To disable a pre-installed app or malware on your Android phone,open the Settings app on your device, then click Apps in the menu. Now in the list of apps installed on your device, click on the app you want to remove from your phone. Be careful as disabling or deleting any critical system app from your device may cause problems in the normal functioning of your Android phone. Once you get to the page of the app you want to remove from your phone, just click on the disable option and let the app wipe all related data from your device and restore it to the version the phone was first purchased with. The app is now disabled on your phone which basically means you can't use it anymore and it won't run in the background. However, it is still stored in your device's memory and you can activate and start using it at any time by updating it to the latest available version. You can also long press an app and select disable to disable or delete the app directly from the home screen or app drawer. However, this method is not recommended as some apps may not have an option to disable in the long press menu. ADB If you want to completely uninstall an app from your Android phone instead of just disabling it, follow the steps below. Note. This method does not require root access, but you will need access to a laptop or computer to use this method. Make sure that the correct USB drivers for your Android device are installed on your PC or laptop. If not, you can go to your device manufacturer's website to download and install the latest official drivers for your device. Once you've purchased your drivers, download the official ADB tools from here, then unzip them to an easily accessible location on your computer. Open the settings app and go to developer options on your device. If you haven't enabled developer options yet, go to the software information in your phone settings - about.Now tap the build number details seven times until you see the option to unlock developer options. You can now access the developer options at the bottom of the Settings app. From there, go to the USB Debugging option and then turn it on. Now connect your Android device to your computer using a USB cable and make sure the file transfer mode is selected. Open the folder you extracted the ADB tools file to, then open a command prompt or Windows PowerShell window in that location by holding down the Shift key, then right-clicking in an empty space and selecting "Open PowerShell window here". Make sure your Android device is connected to your computer via USB, then type "adb devices" when prompted. Now a pop-up will appear on your Android device asking you to allow USB debugging on your computer. Click OK to continue. Download and install App Inspector on your Android device. Open the app, then select the pre-installed app or bloatware you want to uninstall from the list of installed apps on your device and note the app's package name. Type the following commands one by one in the Command Prompt window. device adb adb shell pm uninstall "k" user 0 "package name" For example, to uninstall Microsoft Word from an Android device, simply type pm uninstall "k" user 0 com .microsoft.office.word to avoid uninstalling important applications like this may affect the functionality of the device. If you're not sure what an app does, don't uninstall it. After following the steps in the above method, the selected app will be uninstalled and removed from your Android device. Even if it is not available for use on your device, you can always install the app from the Google Play Store or by installing the APK file on your device if you change your mind. The app will also be restored if you ever factory reset your device.Selected outbound links may contain affiliate tracking codes and AndroidGuys may receive compensation for purchases.
