A layout defines the structure of a user interface in your app, as in an activity. All layout elements are constructed using a hierarchy of View and ViewGroup objects. A view usually draws something that the user can see and interact with. While a ViewGroup is an invisible container that defines the layout structure for View objects and other ViewGroups, as shown in Figure 1. Figure 1. Illustration of a view hierarchy, which defines a layout of the user interface View objects are usually called “widgets” and can be one of many subclasses, such as Button or TextView. ViewGroup objects are usually called “layouts” and can be one of many types that provide a different layout structure, such as LinearLayout or ConstraintLayout . You can declare a layout in two ways: Declare UI elements in XML. Android provides a simple XML vocabulary that matches View classes and subclasses, such as those for widgets and layouts. You can also use the Android Studio Layout Editor to build the XML layout using a drag-and-drop interface. Snapshot of layout elements at runtime. Your app can create View and ViewGroup objects (and manipulate their properties) programmatically. Declaring your UI in XML allows you to separate the presentation of your app from the code that controls its behavior. The use of XML files also makes it easy to provide different layouts for different screen sizes and orientations (discussed later in Supporting different screen sizes). The Android framework gives you the flexibility to use one or both of these methods to build your app’s UI. For example, you can declare your appâs default layouts in XML, and then change the layout as you run it. Tip: To debug the layout during runtime, use the Layout Inspector tool. Writing XML Using Android’s XML vocabulary, you can quickly design the UI layouts and the screen elements they contain, just as you create HTML web pages with a set of nested elements. Each layout file must contain exactly one root element, which must be a View or ViewGroup object. Once the root element is defined, you can add other layout objects or widgets as child elements to gradually build a View hierarchy that defines your layout. For example, here's an XML layout that uses a vertical LinearLayout to hold a TextView and a Button:
