How to split up pdf files

By Joshua Bailey An MKV file can get pretty large if it is an HD video file. It can reach in excess of ten to twenty gigabytes. If this is the case, and the device you plan on watching the file from does not support file sizes that big, you are going to need to split the file into a few different MKV files. MKVMerge does an excellent job at this and is freeware. Download and install MKVMerge from the Resource section of this guide. MKVMerge is free software that allows you to create, split and join MKV files from other video file formats. Once the program is installed, open it by double-clicking the icon from your desktop. Click the “Add” button on the top portion of MKVMerge. A new window will appear allowing you to search for your MKV file on your computer. Select it and click “Open” to load it into MKVMerge. Press the “Global” tab at the top of the program. Click “Enable Splitting” from the “Splitting” section of the menu that appears. Here you can choose how to split the MKV file. You can split by size or time. If you select “After this size” click the drop-down box to select the size of each file split. If you are selecting “After this duration” click its corresponding drop-down box and select how long you want the MKV file’s duration to last. Click the “Browse” button at the bottom of the program and select where you want to save the new MKV files. Click “Save” when you have found the proper place, and press the “Start Muxing” button at the bottom of the program and your MKV file will be split into different parts according to your settings. Wait as the program muxes the MKV file into its different parts. When it completes, locate your new MKV files from the location you designated in step four. Tax laws governing divorced taxpayers are complex, but a few simple rules can help you accurately prepare your tax return. The Internal Revenue Service (IRS) considers only one parent to be the custodial parent of a dependent. However, the custodial parent can allow the noncustodial parent to claim the dependent on tax Form 1040. Only a custodial parent can file as head of household. The only way the IRS allows divorced parents to split dependents is if one dependent lives with one parent more than 50 percent of the time, and another dependent lives with the other parent more than 50 percent of the time. In that case, each parent is considered a custodial parent of a dependent. In most cases, parents try to keep siblings together, so the custodial parent claims the children as dependents on Form 1040. As the custodial parent, you are responsible for the primary care of your dependents. You can receive alimony and child support and retain your legal right as the custodial parent. The IRS allows you to claim each dependent as an exemption on your federal tax return as long as your children live with you more than half of the year. Only a custodial parent can file as head of household on her federal tax return. Unless each parent has primary custody of a different child, only the custodial parent can file as head of household. In most divorce cases, only one parent files as head of household and the other parent files as a single. According to the IRS, a custodial parent can file Form 8332, which gives a noncustodial parent permission to claim a dependent on his federal return for that particular year. Form 8332 is the Release/Revocation of Release of Claim to Exemption for Child of Divorced or Separated Parents. If the noncustodial parent claims the child on his federal return, the custodial parent cannot claim the child. The noncustodial parent cannot claim head of household because the dependent still lives with the custodial parent more than 50 percent of the year. Writer Bio As curriculum developer and educator, Kristine Tucker has enjoyed the plethora of English assignments she's read (and graded!) over the years. Her experiences as vice-president of an energy consulting firm have given her the opportunity to explore business writing and HR. Tucker has a BA and holds Ohio teaching credentials. Married taxpayers might want to consider the pros and cons of filing their income tax returns using “married filing separately” status versus filing jointly. Most aren’t sure of how to split their deductions and file separately. The best way to ascertain whether this might be advantageous is to calculate your taxes both ways and then choose the option that results in the lowest combined tax liability. To split your deductions, you must know what the tax law allows and does not allow. Gather your financial records. If you and your spouse use some of the same credit cards or share bank accounts, you'll need to have copies of those records for both you and your spouse. Don't assume you will be able to obtain a copy from your spouse at a later date if the Internal Revenue Service (IRS) audits you. Decide who will claim your eligible dependents. You are permitted to divide dependent exemptions between you as you see fit. Keep in mind that whoever claims a dependent also claims that child’s medical and child care expenses. For example, if you have three children and one of them has substantially more medical or child care expenses, you might claim that child while your spouse claims the other two children to ensure that your deductions are roughly equal. Unlike expenses related to a dependent, however, you and your spouse can split mortgage interest, property taxes and charitable items any way you wish, provided you were both liable for the expenses when they were paid. Review all of your itemized deductions. The IRS requires that if one spouse itemizes, both must do so. You and your spouse can both take the standard deduction instead of itemizing, as long as you are both entitled to use this option. This is usually the deal breaker for couples who are thinking about filing separately because most don't have enough itemized deductions to split between two tax returns. Determine how you will divide other deductions, such as capital gains or losses and business income and expenses. If only one spouse is involved in a business enterprise, that spouse should be the one who reports the income and expenses. Familiarize yourself with the community property laws in your state. Even if your state does not impose income tax, living in a community property state will affect the way you divide income and expenses when you file separate federal returns. Texas, Wisconsin, Idaho, Nevada, California, Louisiana, Arizona, Washington and New Mexico are community property states. Residents of those states must differentiate between separate income and community income, and those numbers must be reflected on your tax returns. Create "dummy" tax returns to decide whether you should file jointly or separately and how your dependents and deductible expenses should be split. Compare the results of filing both ways. In most cases, there will be a significant tax advantage to filing jointly. Keep in mind, too, that both you and your spouse are equally liable for additional taxes the IRS assesses in an audit, except as otherwise provided under your state's community property laws. A split is one of those moves that is really easy for some people and much harder for others. But almost anyone can do a split! Even if you’re as tight as can be you’ll still be able to master it if you work hard at your stretching.A great way to get (or improve) your split is to move through a series of different stretches, from simple to advanced. If you are a beginner, you’ll probably want to master the easier stretches first before moving on to full split stretches.Be sure to do each stretch on both sides – you’ll want a good split on both your right leg and your left leg in order to be a great gymnast. From a kneeling position, put one foot in front of you on a mat, step, or another object about a foot or more off the ground. Bend your leg to 90 degrees, and place your foot flat on the mat. Keeping your hips facing the mat, move your other leg backward, bending your knee behind you, until you form a “mini-split” from knee to knee. Push your hips forward as much as possible, working towards 180 degrees from knee to knee. Keep your chest up and your hands on your front knee. Hold this stretch for 30-60 seconds at a time. From a kneeling position, put one leg up straight in front of you onto the mat. Move your body back, so only your heel is on the mat. Your back leg should be at a 90-degree angle, and your hips should be “square” – they should be facing the mat, not turned one way or the other. Keeping your front leg straight, lean forward as far as possible. Hold this stretch for 30-60 seconds at a time. From a standing position, put one leg on the mat in front of you. Keeping both legs straight and your hips square, lean forward as far as possible. Your back foot should be planted on the ground, with your foot straight or turned slightly out. Ashley Corbin-Teich / Getty Images Move to the floor and try a full split. In your split, be sure that: Your hips are square with your body. Your torso should be facing straight, not to the side, even if squaring your hips means you can’t go down as far Both of your legs are straight and turned slightly outward Your toes are pointed Your chest is up, not leaning forward Beginner Hint: If you aren’t yet flexible enough to do a split with your hands comfortably on the floor, try your split between two objects – mats, springboards, or even books can give you something to put your hands on. Then you’ll be able to do the stretch without leaning forward with your body. To make sure your hips are square, try doing your split against a wall. Your back knee should be almost touching the wall, and your back leg should be bent at a 90-degree angle upward. Be sure that your back foot is pointing straight to the ceiling.You can also do this stretch with a friend holding your leg and helping you to keep your foot pointing straight up. If you can already do a square split on the floor, it's time to put your foot up on a mat. This stretches your legs even further into an oversplit – or a split more than 180 degrees.For even more of a stretch, do your split between two mats or two springboards. Another progression for women is to work towards a ring leap. To do this, arch backwards and bring your back leg up towards your head. A friend can help you with this by pulling on your arms and supporting your leg to help you keep it in position.Your foot should come towards your head in a straight line, not at an angle. Really big files are a common occurrence. As the quality of our media increases, so do the files along with it. Compression software can squeeze an HD-quality film into a single gigabyte file, but it is time-consuming and impractical for most people. What happens when you want to move such a large file? Can you break a large file into smaller chunks to make sharing easier? Here’s how you split a file into multiple files using free software. GSplit GSplit is a free file splitting tool you can use to split up those large files. With GSplit, you can: · Control the individual split file sizes and the output file types · Unite your split files into a single file · Create a custom naming scheme for split files · Use the Express file splitter for rapid file splitting · Create self-uniting split files First up, download and install GSplit. When ready, open GSplit and select Original File from the menu on the left. Browse to the file you want to split. Now, select Destination Folder from the menu, and browse to where you want the multiple split files to end up. Before moving to the Split File! option (where the splitting takes place), open the Type and Size menu. You can use GSplit to split a file into multiple files in a few different ways. For example, you can specify how many output files you want, and GSplit will tell you how big each split piece will be. Alternatively, you can set the size of each output file, and GSplit will tell you how many files that will create. There is also the option to split the files in a specified pattern according to the file contents (although this is an advanced option). Once you decide the file splitting configuration, select Split File!, then Split! GSplit will begin processing your file. The time it takes to split a file into multiple files depends on the complexity of the output options and the size of the original file. GSplit creates a handy executable for when you want to reassemble your files. You’ll find the executable in the same folder as the split files. Double-click the executable file to launch the reassembly process and to confirm the location of the output file. The default executable name is disk1.EXE, although if you create a custom naming scheme it will match your settings. Once you finish splitting your files, check out how to transfer files between computers on the same network. Manually Reassemble Files With GUnite GSplit includes a reassembly tool called GUnite. From the GSplit top menu, select Unite. GUnite will open in a new window. Browse to the location of your split files. You must locate the folder containing the GSplit pieces, carrying the .GSD file extension, as per the image below. Select the first file in the sequence, then Select Output to confirm where you want the file after reconstruction. Finally, select Restore File. Like the file splitting process, the restoration process takes time depending on the file size, number of chunks, and so on. 7-Zip Did you know that the popular free archive tool, 7-Zip, also includes a file splitting tool? Your output files will form part of an archive, which could save you disk space, too. Interested in more free tools? Check out our list of the best free tools for Windows. Back to the best file splitters. With 7-Zip, you can: · Split large files into multiple files · Customize the number of small file parts · Encrypt your output files · Use a variety of compression algorithms to decrease file sizes First up, right-click the file you want to split into smaller pieces, then select 7-Zip > Add to Archive. Give your archive a name. Under Split to Volumes, bytes, input the size of split files you want. There are several options in the dropdown menu, although they may not correspond to your large file. If that’s the case, you can enter a custom output file size. Press OK when you are ready and let 7-Zip split your large file into smaller bits. When you want to reconstruct your file pieces, find the first split file in the archive, right-click and select 7-Zip > Extract to [File Name]. You’ll find your original file in the output folder. FFSJ FFSJ, or the Fastest File Splitter and Joiner, is your final option for splitting and joining large files. With FFSJ, you can: · Split large files into multiple files · Automatically delete source files · Encrypt output files for extra security You’ll find easy to use options allowing you to split your file into equal parts or split using specific file sizes. There is also the option to delete the source file after splitting the file, or to encrypt the output files for extra protection. If you choose to encrypt the files, you must enter a password before the file splitter begins. To split a large file with FFSJ, select your input file, then the output file location. Similarly, when you want to join the split files, open FFSJ, and select the Joining tab. Browse to the folder containing the first split file part, then add an output folder for your reconstructed files. What Is The Best Free Large File Splitter? You have several options to split a file into multiple files. The three options are easy to use and have different file splitting options. For instance, you can use 7-Zip to split and compress your output files, potentially saving space on your hard drive. Once you’ve split your files, you might want to send them to your friends. Check out the best ways to send large files as email attachments.
