Transport canada fuel consumption guide 2015

Datasets provide model-specific fuel consumption ratings and estimated carbon dioxide emissions for new light-duty vehicles for retail sale in Canada. To help you compare vehicles from different model years, the fuel economy ratings for 1995 to 2014 vehicles have been adjusted to reflect the best test that is most representative of daily driving. Please note that these are approximate values that were generated from the original classifications, not from vehicle tests. For more information on fuel economy testing, visit: . To compare the fuel economy information of model vehicles from 1995 to 2021, use the fuel economy rating search tool at . (Data update: October 22, 2021) Page 2 Les ensembles de données provide les cotes de consommation de combustible et les estimations dâ Carbon dioxide emissions specific to each model of new light-duty vehicles sold at retail in Canada. To help you compare vehicles of different model years, the fuel economy ratings for vehicles from 1995 to 2014 have been adjusted to reflect the enhanced test procedure that is more representative of everyday driving. It should be noted that these values are approximate and were derived from the original ratings; they were not derived from vehicle testing. To learn more about fuel economy testing, see: To compare information relating to the fuel consumption of des annÃ © es Modèles de 1995 Ã 2021, Utilisez L'Therche Pour Les Cotes De Consommation de Carburant Ã L'TM ADRESE HTTPS://fcr-ccc.nrcan-rncan.gc.ca/fr. (DONNÉ IS MISS TO: 22 OCTOBRE 2021) A million kilometers of roads. Unique challenges to Canada. Balancing the need to invest with the realities of tax restrictions. 2007: 2011 saw a variety of steps taken to support Canada's competitiveness in a global economy, and make its paths safer for all Canadians. Canada has more than one million kilometres of roads (two lanes equivalent), approximately 38,000 of which make up the national road system (NHS). Please see the RO1 addenda table for more information. Road transport is the most important way for transporting passengers and cargo, local transportation (intra-city) and inter-urban transport, intra-provincial transport and trade between Canada and the United States (in terms of transported value). Canada's road network is shared by a large number of different users, including 20 million light vehicles, 750,000 medium and heavy trucks, 15,000 public transport buses, motorcycles and motorcycles, as well as pedestrians, cyclists and rollerbladers (see RO3, RO4, RO5, RO8, RO11, and RO26). Canada faces many challenges related to its road transport infrastructure. Some are unique to the country, such as its extensive land mass and often climate, high levels of urbanization and high levels of commercial dependence, and some are shared by others, including old road and road infrastructure, limited finance, road safety issues and environmental considerations. These challenges increase pressure for more federal, provincial and municipal spending at a time when economic and financial circumstances are compelling allto consider new and innovative ways of financing transport infrastructure. Given the challenges ahead, including maintaining an efficient highway transportation system to support Canada. Canada. In a global economy, the need for investment will certainly continue. However, in the coming years, government spending at all levels is likely to be limited to the current fiscal situation and competition for financing social sectors, such as health and education. 9.2 2011 year under review Economic Framework and Infrastructure Canadian carriers to hire 225 billion tonnes of freight in 2010, up 8.1% from 2009. Approximately 139 billion tonnes (61.5%) were produced in the domestic sector and 87 billion tonnes in the international sector (see Table RO17). In terms of value, road transport remains the dominant mode of transportation for the transportation of goods between Canada and the United States. UU. In 2011, 45.1% ($149 billion) of exports and 73.5% ($162 billion) of imports were transported between the two countries by rail, accounting for 56.5% of overall Canadian-U.S. trade and 42.7% of all trade between Canada and the world (see Tables EC6, EC7 and EC11). The total value of Canada-U.S. Trade (inward and outward) increased by more than 9%, with almost 82% of Canadian road-based exports to the U.S. passing through border crossings in Ontario and Quebec (see Table EC-10). At the end of 20 101 (latest information available), the NHS covered 38,069 kilometres of key road links vital to Canada’s economy and the mobility of Canadians (see Table RO1). Although an expansion was approved by the Council of Ministers following a review of the NHS in 2005, the road system has not grown significantly since then. 2009 is the most recent year for which information on the road motor vehicle fleet is available. For that year, the composition of the motor vehicle fleet was as follows: 19.7 million cars, light trucks and vans; and 755,000 heavy trucks (gross weight). at least 4.5 tonnes). In 2009, the light-duty fleet generated an estimated total of 303 billion kilometers, 3.2% more than in 2008, while the heavy-duty truck fleet was responsible for an estimated 30 billion kilometers. (5% lower than in 2008 due to With nearly 20 million light passenger vehicles and more than 22 million licensed drivers, this leads to a proportion of more than one car per household in Canada. Tables RO3 to RO9 provide more information on Canada’s motor vehicle fleet. 90% of consumer spending on transport goes to private transport while the remaining 10% is spent on public transport. Vehicle purchases and expenses account for 88% of Canadian family spending on transportation (see Table EC-76). More than 90% of intra-city travel is by car, which can be explained by the fact that most intra-city travel is intra-provincial, short- and medium-distance. 55.47 million cars and 10.54 million trucks crossed the border between Canada and the United States, an 8% increase in car traffic since 2010 and less than 1% in truck traffic. Overall traffic volumes were 7% higher than 2010 levels (see Tables RO19 and RO20). Public transit continues to grow across the country, with new mass transit infrastructure projects planned in Montreal, Ottawa, Toronto, Edmonton and Vancouver, and active transportation is becoming more popular, in part due to the introduction of cycling participation programs in Montreal, Ottawa and Toronto. In 2010, revenues from the bus industry (including government contributions) were estimated at $14.3 billion, an increase of 4.6 per cent over the previous year. The public transit sector accounted for 52.5% of the total revenues of the bus industry, excluding government contributions (see Table RO21). Provinces continued to respond to a 2010 federal/provincial/territorial task force report, which recommended that jurisdictions relax regulatory controls on intercity carriers. In Manitoba, an agreement to subsidize Greyhound services was extended until March 31, 2012. The grant is $3.12 million for fiscal year 2010â11 and $3.9 million for fiscal year 2011â12. For its part, Alberta deregulated intercity bus service on October 1, 2011. Other provinces Your options, while service dropouts2 are still moderate. Greyhound, the main carrier, left 12 low density runners and the reduction of the frequency of service in others, but the early indications of possible replacement services that arise were positive. In December 2011, Akkadian bus services in New Brunswick and Prince Edward Island were arrested by a strike, and Groupe OrlÃ © NS (owner of Acadian) announced that his father FrancÃ © Ã © Ã © Olis had acquired 25% of remaining interest in the company as of December. 31, 2011, making OrlÃƒ Ã © Anns to a total property subsidiary. Environment in 20093, greenhouse gas emissions (GHG) of road transport were 141 mt CO2E (equivalent carbon dioxide). Road transport represented 82.5% of national GHG emissions, and 19% of total Canadian emissions (see Figure EN15). The road load represented 63.7 mt co2e, which represents 37% of Canadian transport emissions in 2008, while the transport of passengers on the road represented 77.2 MT CO2E, which represents 45% of Canadian transport emissions (See figure in16). Participation of polluting emissions from transport transport transport transportation counted 7% of PM 2.5 emissions (particulate matter to less than 2.5 micron diameter), less than 1% of SOX emissions (oxide of sulfur), 20% of NOx emissions (nitrogen oxide), 3% of VOC emissions (volunteel organic compounds) and 2% of CO emissions (carbon monophole) in 2009. The participation From the transport of cargo passengers from 2009, transport air pollutants represent 2% of PM 2.5 emissions, 2% of SOX emissions, 16% of NOx emissions, 40% of VOC emissions and 55% of CO emissions. Under the of passengers and greenhouse gas emission regulations, which are aligned with the regulations of the United States, the Canadian Government began to regulate automobiles and light trucks of the 2011 model years to 2016. In November 2011 , Environment Canada published a discussion document on the proposal. Regulatory approach for GHG emissions of Vehicles and light trucks with model years 2017 to 20254 for a 30-day comment period. Security The Motor Vehicle Safety Act was amended in 2011 to allow used vehicles to import from Mexico, a change linked to a free trade agreement commitment from North America. The Act was also amended to allow Canadian residents to have rental vehicles across the U.S.-Canada border for a period of 30 days or less for non-commercial purposes (non-Canadians could already carry rental vehicles to Canada). The Road Safety Vision 2010 (RSV 2010), Canada's National Road Safety Plan, was replaced by the 2015 Road Safety Strategy. With this long-term vision, the Canadian Motor Transport Managers Council (CCMTA) hopes to make Canadian roads safer. the world. Key elements of the new strategy include a more holistic approach to road safety; setting up a framework for best practice strategies for use by all stakeholders; and measuring progress at the national level using the most appropriate measures based on rates (e.g., death or serious injury). The United Nations has declared 2011: 2020 the decade of action for road safety, the goal is to stabilize and then reduce the predicted level of transit deaths worldwide. If current trends prevail, road deaths will become the fifth cause of death in the world. Canada was one of the sponsors of this initiative, which is coordinated by the World Health Organization. 2011 was the year of road safety in Canada, and several actions and initiatives were introduced to improve road safety and support the United Nations decade of action for road safety and the Canada Road Safety Strategy 2015. Securityof Action Items in the Joint The Canadian-American perimeter security declaration will involve road safety elements, including the integrated incoming load action element, which strives to expedite the movement ofLoad to and from the United States, this action article will include pilot projects led by the Canada Border Services Agency and the Protection of Customs and Borders of the United States and supported by Canada's transport. One of these pilot projects will examine the incoming movement of goods by truck from the port of Montreal to the US border. UU. 9.377 "11 Summary Economic Framework and Infrastructure A variety of transport vehicles of different sizes and configurations use the Canadian road network, including Motorways, buses, motorcycles and trucks. Road-sharing vehicles are used for private or commercial passenger or transportation activities. Trucks for truck rental has increased, and in 2011, its actual gross domestic product (GDP) was 6.3% higher than in 2006. The activity slowed down during the economic recession of 2008, 2009 (in 2009 it was a 5% lower than in 2006) But it grew strongly in 2010, 20116. Employment has been slow to recover: in January 2011, rental transport employed 2.9% less workers than in January 2006.7 The decrease in the activity of trucks for rentals was evident in both national traffic and cross-border traffic, although less severe in the transfer. Border sector. In 20098, the kilometres of ton of domestic trafficking were 6.3% lower than 2006, compared with a decrease of 4.4% in cross-border trafficking. Interurban buses up to 2009, the commercial intercity bus industry and the regulatory regime under which they operated seemed stable and indicated modest growth. In exchange for a continuous service on low-density routes, the commercial intercity industry in most Canadian provinces operated under rules protecting competitors from competition.Higher density. Rental and tourism operators were deregulated and operated largely in a different set of regulations. However, in reality, rural and small low-density community services were attending to market markets because more people possessed automobiles and populations aged with less travel needs. The services of the bus parcelling were a one of income for many routes, sometimes ensuring profitability, but these have gradually faced the growing competition of the messaging industry, which reduces the viability of intercity bus services to smaller communities. In 2009, Greyhound Canada, the largest carrier of Canadian intercities, informed the federal government and the provinces and territories where it operated that it was losing money on its low-density routes, and that without financial support or changes in the regulatory regime, it would not be able to maintain current levels of service. In the same year, Groupe OrlÃ © ANS requested permission from regulators in Nova Scotia and New Brunswick to reduce service on routes driven by its subsidiary, Acadian. Similar developments were observed throughout Canada to some extent, with the exceptions of Newfoundland and Labrador and Nunavut.9 In response to these developments, Canada ' s federal, provincial and territorial governments established a working group on intercity bus services. A report published in September 2010 recommended that individual provinces adjust their regulatory regimes to facilitate transporters to make changes in service and to bring new, alternative and replacement services into the market. The establishment of the Working Group led to bilateral discussions between transporters and provinces, even when the working group was working. In Manitoba, for example, Greyhound negotiated an agreement with the province in 2010 under which the service would continue in exchange for a grant. In several other provinces, the carriers continued to work through the regulatory process. The industry's financial position seems to be improved, but the pressure on regulatory provinces to relax controls will continue to be an important issue in regulating the Canadian bus in the immediate term.Intercity Curbside bus service is a niche market in Canada and the United States. In general, companies in this sector sell tickets on the Internet; Use a price model of the AÃ © rea; Choose customers in several center belts. center. and provide more comforts than standard bus services (e.g., top quality seats, Wi-Fi and snack bars). Coach Canada and Megabus have entered this market, operating between Buffalo and Toronto and between Toronto and Montreal. To serve travellers, the Ontario Transit Go has recently expanded into intercity markets, such as Kitchener, St. Catharines and Peterborough through the bus and/or rail service. The roads since 2006, 2007, have invested nearly $17.4 billion in the NHS for all levels of government, and the amounts increase from $2.3 billion in 2006, 2007 to $4 billion in 2010/2011, reaching its peak at $ 4.5 billion in 2009- 2010.10 These investments in 2006, 2010 have been used to extend the NHS with a good conditioned pavement at 12% (2,600 km) and to decrease the pavement length in poor condition by 22% (800 km). During the same period, the duration of the NHS was not paved by more than 24 per cent (800 km). The NHS also has more than 8,700 bridges, of which 60% are over 30 years old. However, due to increased government investment, the number of bridges under 10 years increased by 16 per cent between 2006 and 2010, from 896 to 1,223. In contrast, the ageing infrastructure remains a problem, as the number of bridges of 50 years or older increased from 870 to 1,318 between 2006 and 2010, an increase of more than 50%. Since 2007, nearly 700 bridges in the NHS have been rebuilt or have undergone significant rehabilitation. Between 2005 and 2008 (the latest available data), total travel in the NHS increased by more than 6% (from 119 to 127 billion kilometers of vehicles), while travel to trucks increased by approximately 9% (from 18 to 19.6 billion kilometers of vehicles). Nearly 93 per cent of the car trip and 95 per cent of truck trips in Canada occurred in CanadaCore National Highwordsystem.11, while the number of collisions over the NHS remained relatively stable between 2005 and 2008, the number of injuries per year decreased by 10% and fatalities by about 30% over the same period. Observing 2005- 2008 2008 the injury rate for the NHS is significantly lower, about 50% lower, than for Canada’s road network as a whole. While the National Central Highway System’s mortality rate is lower than that of all roads in Canada, mortality rates on the Feeder and Northern and Remote National Highway Systems are higher than the Canadian average. Land border crossings The value of two-way trade between Canada and the United States using NHS border crossings declined by about 18% between 2006 and 2010, while the value of cross-border tourism grew modestly by 2% over the same period. The current challenges at the border are the result of balancing trade with greater security in a post-9/11 world. The perceived difficulty of importing and exporting goods is mainly related to increased paperwork, border delays, costs and regulatory requirements. Some industries, such as informatics and electronics and aerospace, have been affected more than others. 12 Public transit Since 2007, the public transit has experienced an increase in driving and activity. Those five years were marked by the opening of a new SkyTrain line, the CanadaLine in Vancouver and the expansion of the Montreal metro in Laval. Toronto and Montreal ordered the renovation of part of their subway’s rolling platform, and the new Bombardier trains in Toronto began service in July 2011. Calgary saw an expansion of its C-Train network with the opening of McKnight (2007) and Crowfoot (2009). Two additional stations are expected to open in 2012. Meanwhile, connectivity between the public transit and airports has been increased, benefiting travellers, contestants and greeters and airport employees. Vancouver’s CanadaLine, such as the 300 Quick Bus Transit de calgary and the Montreal 747 bus line, are all examples of new direct access to the airports opened during that five-year period. join other existing services, such as the bus line of ottawa 97 transitway, transitway,the airport, the center and Bells Corners, the 197 Rocket of Toronto that connects Pearson International Airport with Kipling Station, and the bus routes of Winnipeg Transit 15 and 20, which travel between the airport and the center. Edmonton International The airport is expected to have a quick bus transit service in the spring of 2012. Environment Between 1990 and 2008, GHG emissions from light vehicles (LDVs) increased by approximately 14 Mt CO2e—approximately 1% per year or 21 per cent in general—from 71.7 Mt CO2e to 86 Mt CO2e. This can be attributed to population growth and increased passenger activity, as well as a shift towards less efficient light trucks and sports-usual vehicles. From 1990 to 2009, the proportion of total emissions generated by air polluting emissions from light vehicles generally decreased. Between 1990 and 2009, PM 2.5 emissions fell around 2,600 tons, SOx emissions by 11,443 tons, and NOx and VOC emissions by approximately 366,000 tonnes and 411 thousand tonnes, respectively; carbon monoxide also fell at about 5 Mt. Between 2008 and 2020, LDV GHG emissions are expected to decrease by 0.6 per cent per year, a decrease of 86 Mt CO2e in 2008 The implementation of the Greenhouse Vehicle Gas Emission Regulations for model years 2011 to 2016 and the Renewable Fuel Regulations represent most of the expected decrease. However, this estimate does not take into account the GHG emission regulations planned for 2017 to 2025 model year. Without regulation of GHG emissions for VVDs, total DV emissions would increase in the same period from 86 Mt CO2e to 89 Mt CO2e. Also during the period 2008-2020, GDP is expected to grow by 1.9% and the population by 0.9% per year, or by 25% and 12% in general, respectively.1990 to 2008, GHG emissions from medium and heavy vehicles increased by approximately 27 Mt to an average of 3.9 per cent per year, or 96 per cent in general, generally,28 to 55 Mt. This can be explained in part by the increasing share of freight moving by trucks. HDV contributes mainly to NOx emissions and only marginally to other air pollutant emissions. All HDV-related air pollutant emissions decreased significantly from 1990 to 2009: PM 2.5 emissions of 13,196 tonnes; SOx emissions of 21,079 tonnes; NOx and VOCs of 88,496 tonnes and 43,302 tonnes, respectively; and CO emissions of 695,934 tonnes. Starting with the 2007 model year, HDV engines were required to meet the 2007-2010 emission standards in the Vehicle and Loading Engine Emissions Regulations, which comply with the Canadian Environmental Protection Act, 1999. These are aligned with US regulations. On May 21, 2010, Canada and the United States announced that they would regulate GHG emissions from new HDVs on the road, and the proposed Canadian regulations would also be harmonized with those of the United States. On October 25, 2010, the United States published proposed standards to reduce GHG emissions from new HDVs on the roads of 2014 and beyond. On the same day, the Government of Canada released an initial consultation paper to solicit early views from stakeholders. Safety Road Safety Vision 2010 (RSV 2010) was Canada’s national road safety plan from January 2002 to December 2010, and the overall quantitative goal of the plan was to reduce the average number of road users killed or seriously injured in traffic collisions by 30% or more during this period. Provinces and territories undertook various initiatives to raise awareness and improve road safety in their jurisdictions. A mid-term review of the 2010 RSV prompted most jurisdictions to develop new initiatives or increase their efforts in three important areas of road safety: Driving, the non-use of safety belts and acceleration / acceleration of conduction. A summary report of the 2010 RSV progress will be completed once final data on road safety is available from all provinces and territories. Since 2008, Canada has maintained the National Day of Remembrance for Road Victims on Wednesday following the third Sunday of November. This day helps Canadians to remember and respect those who have died or been affected by road accidents, and reminds Canadians of the importance of driving safely. Between 2007 and 2011, 2,157 vehicle withdrawals were announced13, or on average 431 per year. 2010 only saw a record 468 memories. Security Increased security needs at the border have resulted in complaints about longer waiting times. Both Canada and the United States have responded in a number of ways, including infrastructure improvement and adjustment; increased staffing; implementation of technological solutions; reduction of finite resources; and initiation of programmes to accelerate low-risk goods and travellers. Efforts continue to be made to standardize and improve the collection and dissemination of border waiting times. 9.4 Economic framework and infrastructure Truck industry, which includes 56,800 companies, is composed of carriers for the transport of 14 vehicles, private carriers15, owners 16 and couriers 17. Another category of “other” trucks includes all trucks used for purposes other than transporting goods commercially, for example, a construction

company that uses trucks to transport heavy machinery to a workplace. The size of the fleet, the type of equipment, the geographical scope of operations, the type of service and the type of freight led to all differentiated truck companies. The results of Statistics Canada's 2010 Annual Truck Survey18 show that the national fleet in 2010 included 121,000 road tractors, 61,000 power units and 302,000 unpowered units such as trailers, vans and flat beds. In 2010, companiesThey employed 201,000 people, including 128,000 salad drivers, and another 54,000 owner operators. The annual triumgage survey also indicated that the truck industry reported $ 40.8 billion in operating income in 2010, an increase of 4.9% as of 2009. The operating expenses amounted to 4.6% to 37.9 Millions of dollars. El el operating expenses were led by the fuel costs of the vehicle (12.2 per cent), followed by insurance premiums (59 per cent) and wages, wages and benefits (5.6 per cent). the operating margin of the indotria increased by 10.0% to $2.9 billion. the 4,800 larger companies (those with annual operating income of $1,3 million or more) recorded an increase of 6.0% in operating income and an increase of 4.5% in operating expenses, while the remaining smaller companies reported an increase of 2% in income and a growth of 4.7%. in the expenses. Long-haul truck companies reported $26,7 billion in operating revenues, an increase of 3.0%, while local truck companies reported revenues of $14,1 billion, 8.8 percent in a year. national freight movements accounted for 77% of total revenues, with the remainder divided almost evenly between transboundary import and export movements. pressures that have shaped the indotria of trucks recently will continue for at least several more years. To remain competitive, truck carriers must continue to find operational efficiency to offset the costs of inputs in the increase in the costs of inputs, as environmental tightening regulations will lead to more expensive trucks, fuel costs will continue to rise, and the highest environmental, safety and technical standards will require improved equipment and procedures. increasingly strict safety and security requirements can reduce the group of potential drivers, which is problematic such as recruiting and retaining qualified drivers is already difficult when demand for trucks is strong. the congestion of the road in urban areas is growing and creating delays for the cargo that originates, ends or moves through these areas. the indotriaFrom the trucks continued to face challenges associated with the increase of security measures implemented after 9/11 "measures that often result in delays at the border and additional regulatory requirements that increase industry costs. While these factors They are challenging, carriers have a high history record by adapting to changing circumstances. In 2011, some great big companies continued to consolidate their business activities through acquisitions and mergers. For example, transforce inc, which owns the largest fleet of canadá trucks, continued to increase and diversify its business activities in 2011 mainly through acquisitions in the package and the messaging business. transforce acquired Canadian dhl operations in spring 2011. Transforce is expected to continue growing, as the company is looking for more acquisitions south of the border. Long combined vehicles in canadá, any combination of vehicles of more than 25 meters of total length is considered a long combination vehicle (lcv.) the configuration of lcv trucks was introduced more than 25 years ago in new scot, new brunswick and ontario; as a result, the lcvs are now allowed on some roads in all provinces/territories, except terranova and labrador, princeed island the federal-provincial-territorial memorandum that defines the accepted trucks at the national level of canadá was modified three times19, introducing, among other things, an exemption for an aerodynamic device from the tail of the boat up to two feet long (when it measures the length of a truck,) an exemption for an auxiliary power unit (when it measures the weight of a truck,) and a maximum weight allowed in the allowed. the common lcv configurations that are observed in canadá include a trace of tractors: two long trailers of 48' (14.6 m) or 53' (16.2 m,) called turnpike doubles; one long 48' or 53' (14.6 m or 16.2 m) and a short trailer of 28' or 28.5' (8.5 m or 8.7 m) being common rocky doubles;5 m or 3,5 m, 3 m, 3 m, 3 m, 3 m, 3 m, 5 m, 3 m, 5 m, 3 m, 3 m, 3 m, 3 m, 3 m, 3 m, 5 m, 3 m, 5 m, 3 m, 5 m, 5 m, 3 m, 3 m, 3 m, 3 m, 3 m, 3
