This article describes how to create calculated measures in an SSAS Cube for use in MDX queries and a SSAS Model from a Tabular Database for use in DAX queries. When adding each Calculated Measure in Cube and Model Visual Studio projects, these projects will be sent and processed to update the database and then SSMS, the database will have to be updated to see the newly added Calculated measures. To create measurements calculated on a Cube, double-click the Cube Calculations page in Visual Studio. Right-click the Calculate item and select the New Calculated Member to get a blank Form View or click the New Calculated Member button (held in Yellow). Enter a name for the calculated measure and Expression. You can add the Format and Associate Measure Group string, as well as the visible property and non-empty behavior here too. This measure is a calculation to show the remaining profit after the Sales Amount has the total cost of the subtracted product from it. Write an MDX consultation with calculated measures After saving the cube and Depiling and Processing it, open SSMS in the Analysis Services to see the new measure. The MDX search below uses the newly created measure and the sales amount of the Sales Measure of the Fact Finder as columns and extracts the category name as the line. It should be noted that this consultation does not specify Members, children, members of the currency, etc. so that the line reads for All categories. Select {ÂÂÂÂ ME160;[Measures][Luke on the quantity of sales], Â Josuï160;[Measures][Salesmount]]} in 0, Â MELHORAME160;[Dim Product Category]. [Type Name] in 1 Â Josep 160; DE [AdventureWorksResellerDW2012]; Adding. Members of the category Name, the individual categories appear in the query lines. Select {ÂÂÂÂ ME160;[Measures][Luke on the quantity of sales], Â Josuï160;[Measures][Salesmount]]} in 0, Âdim products]. [Category name]. Members in 1 ÃÂÂÂ ME160; FROM [AdventureWorksResellerDW2012]; This next calculated measure uses the Sales Quota Amount measure and subtracts the sales amount from it to obtain the difference. In an MDX query, we can show the sales value quota for each employee, as well as its sales values and the calculated measure showing the difference. Select {[Measures]. [Sales account measures], [Measures]. [Sales amount], Á â¬ [Measures]. [Sales amount], [Measures]. [SALE COTARÃÃO Menos Montas]} in columns, {[Dim employee]. [Full Name] .members} in lines of [Adventureworksresellerdw2012]; If the values for sales quota and sales amount have not had their format string property set to currency, we can rewrite the query to add some members with strings formatted for each. It © also been the not empty office for employees to filter only employees who have sales quotas and sales amounts. member [Measures]. [Sales Quota] as [Measures]. [Sales Quota], Format_String = "Currency" Member [Measures]. [Total sales] as [Measures]. [Sales], Format_String = " Currency "Select {[Measures]. [Sales sales measures], [Measures]. [SALES COTARÃÃO], [Measures]. [Total sales]. [Measures]. [Sales mounts Less value]} in columns , Not empty {[DIM function]. [Full Name] .members} In rows of [adventureworksresellerdw2012] Another measure calculated to calculate the percentage of sales value for the sales assembly quotas goal © added here. The MDX query is using a cross join in the calendar year and percent sales quota to determine what percentage of the sales quota for each employee was met. Select [Order date]. [calendar year] .Children * [Measures]. [PCT sales quota] in columns, not NEEMPTY ([Full Name] .Children) in lines of [Adventureworksreselledw2012]; The next calculated measure will be for a reseller sales amount that takes the current year provided and subtracts the sales amount from the previous year to obtain the difference in year after year sales values. The screen will display a profit or loss between the two First, we will get the sales values of the reselleramount} in 0, â Jos160;
