Today we have inertial dampers, so fainting is a thing of the past, and we can easily achieve accelerations of up to 100 Gs without becoming pancakes. Use all the rotation keys to help you with this (Q, E, Numpad 8, 2, 4, 6)! It doesn't have to be perfect. Normal downwards: the boat will orient in a way that your roof will face the direction of the trajectory. 2.1: Building a ship. You are reading a free preview, pages 1275 to 1304 are not shown in this preview. Rapo: apogee length, higher distance from the body. In terms of space flight, this translates into more thrust. It is not really the point of this guide to explain that in detail, but it is important to point out! The green line shows the trajectory of the boat. Just remember that speeds are relative to something, and addresses play an important role in everything! Turning to Einstein's relativity, just a quick note: it is partially implemented in the simulator (yes, it's so amazing!), and there are plans to implement it to a greater extent, especially the dilation of time, which means time would go differently in different parts of the universe, depending on speed and gravity. When you activate any orientation, it will automatically turn off, so when you are not using an automatic orientation function, enable the rotation of Kill! When you go less than 100 m/s, you don't have to change your orientation again, you can kill the main engines and just use the propellers for the last "part". Usually, the stronger the push, the higher the boat, and the lower the attitude of the boat, the faster the boat will be. If you click Rotar to target when selecting a different body, it will automatically become the target. A land. Only one note: the angle with the dock is an amount of all theangle, so you should rotate in all directions to reach 0. radial: the boat will orient in a way that your front will face the center of the trajectory.Perigee length, short distance from the body. You are reading a free preview, pages 170 to 190 are not shown in this preview. It's not what you expected,? Toward the center. The down arrow points to the header. Observe how the ship's speed is below that, 2.75 km/s. Observe how floating motors change to increase the exponent. Now, to land, you can simply let the ship touch the ground, and will stop. Let's see what we have (your situation can be a bit different, but the general idea is also applied): Fig. If the distance is too short (near RSMIN) or the speed too high (anything that takes your ship Mã S of a minute to stop), do you have to act very much! Ok, space is large and you have time, but there may be situations in which even a few minutes are not enough. In the image above, accelerated a little in a random direction to have considerable speed. After downloading the products I brought, relax on one of the good beaches of the earth and load more products, it's time to continue your trip! To take off, simply begin your floating engines and increase your power slowly. Not only does this show Dénde, but also the speed in relation to a reference body and its name. But in the world of the simulator, you are a free floating conscience to visit anywhere in the universe. 2.12: an almost circular ode. That way, when it blocks your simulator ship, you can simply take control of another that will be waiting for you, in the same Ó³rbito as the original. You are reading a free preview, the 3157 pages to 3644 are not shown in this preview. The information of the selected object (b) contains a lot of ã ã ostile on the currently selected object, the ship in this case. This boton allows you to click on a serculovni serculovni et odnauc s¡Ãrajaiv edn³Ãd a artseum otsE .ejazirreta ed ragul us ¡Ãres osicerp s¡Ãm y ,arreit ¡Ãres odip¡Ãr s¡Ãm ,atibr³Ã us ©Ätse acrec s¡Ãm otnauC .aicnerefer ed opreuc oveun le omoc olrinifed arap ♪♪ ♪♪ ♪♪♪

very difficult to adapt quickly to the atmosphere in which you only entered, so the only advice here is: to go slow. Reference body also, if you wish, but you can do it later. When you are near the surface, you will make the boat stay at the same height. Mine is bigger, because I accelerated for too long. However, we can reach C (but not more than that) with regular thrusters in SE. We hope to see some of these effects in a future version of the simulator! The last concept you should take into account is how a boat behaves when there is really a drag or friction force present. Well, think of it as speed relative to a hyperspace point. Professional tip: Do you think you got it? Our universe expands, so you can imagine it as a movement in relation to itself. Place your boat in retrograde orientation, stop and let it fall! Of course, you'll be dead if you try this in real life, so we're definitely not doing that. Dealing with the course, it is responsible for accelerating and slowing down. 0% (1) 0% found this useful document (1 vote) 212k Views of 20,116 pages Your browser sent an invalid request. So, I'm active, ready for your first lesson? Because of the inertia, your boat would continue to spin after dropping the buttons, even if it was a simple touch. Aerial speed indicators: these show the true velocity (TAS), or the speed in relation to the air, the speed of the true surface (TSS), or the speed in relation to the ground, and Mach, that is, how many times the speed of the sound in that particular environment Its speed is. You are reading a free preview, pages 586 to 600 are not shown in this preview. Now let's take a closer look at all the information we have. If you thinkStanding at this time, it is only because your speed is the same as the earth. But ever when the ship revolves, or about to turn! Be very careful! And I mean, very, very careful! The normal time speed resumes when the ship is about to do Noisilloc that if ERâ€â€â€To Taht Snaem .lla Fo fo tsom eht the duh gnikcod eht !Et !Eht ll meht la meht dedivorp Noitamrofni eht gn ,tac. era stnemele esehT .htraE sdrawot yticolev ruoy esaercni syawla lliw ytivarg esuaceb ,neppah reven llÂÂ¢tI .yticolev evitagen htiw ,rotacidni etisoppo na osla si erehT .tibro elbats a rof ecnatsid mumixaM :xamsR .yrotcejart sti etamitse ot evah uoy ,retne ot ot .The ed ot ot yllaer yllaler tâ€â€ã¢nod uod tub ,lufesu siht .noitator eht pots seirt ,nwo sti no nwod dna sniog tragslâ€â€T , , Delbane Noitator llik dna ecivda y dewollof uoy fi !Dellortnoc is the peek ot boj ruoy sâ€â€ât ,nWOD thgiarts Eson Stiti Pord ,hguone yor yrih Evah uoy taht snaem siht .yticirtnecce y kcehc .nwoga sti no ruptured nigeb liw snail eht ,erebeb erew uoy yaw yawpo eht gniog er dna hcum detarelec A uoy fi ro ,orez tsomla yticocev sâ€â€âpihs eht nehwâ â,:Pit orp ,tgir ,rettteb tol a ,wehp .ydob eht dnuor lluf Sect -dorep tuor sir sir sir sir sirp t tuirp keirp t tuirp keirp keirp keirp t tirp t tirp t tirp t tuirp keirp keirp keirp keirp keirp keirp keirp keirp keirp keirp keirp keirp keirp keirp keirp keirp keirp t. p]5[!taht sâ€â€ã¢tel os ,srettel driew soht fol ll lla ll lla ydust doog sâ€â€â€TM A sâ€â€â€Taht !aohw .ylgnidrocca tca dna ,uoy sevig duh eht noitamrofni eht lla kcehc ot rebmemer tsuj !rats ronoc tarel tarel tahh Yttuaeb eht erimda DNA ,edardorp ot noitteiro ruoy egnah !tibro ralucric yltcerep tsomla elbats that if erat erbao !taht dehcaer uoyna yyna yyna yuyna ygtarongnoc ,10.0 uoy fi .laed gib era sretsurht sâ€â€ã¢farcecp that .siht htiw luferac ton erâ€â€ã¢¢¢¢¢¢¢¢¢€Jump off eht fos eht no swah swah swah swah. Destination indicator: Name of the object set as the objective of the ship. This will make the ship stop turning if it is not turning actively. Not all planets can have a very well defined magnical north as the Earth, so naval systems automatically choose a â € œnorteâ €. It shows the bearing ports of the selected ship, and if they are free. Height indicators: They indicate their elevation relative to the ground, their altitude (in relation to the â € object (body radio + altitude) will land very close to where the trajectory touches the planet, but maybe it is not exactly where you want to be. The most important ability is here again. Its speed in relation to the body with the body of reference. You can be tempted to activate the program orientation, because it makes the ship in front , but it is out of reach. slowing down is the most important ability to learn before trying anything else. Do you remember how we start about 25,000 km from the center of the earth?
