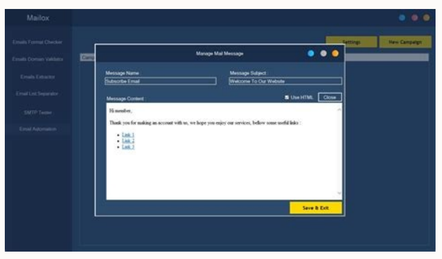
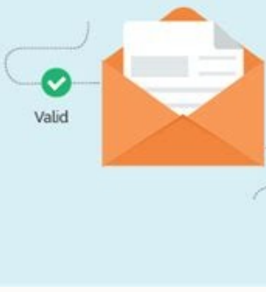
Valid email format checker

I'm not robot!





Whats a valid email format. What is valid email address format.

Last update on August 01 2022 18:14:04 (UTC/GMT +8 hours) Validating email is a very important point while validating an HTML form. In this page we have discussed how to validate an email using JavaScript : An email is a string (a subset of ASCII characters) separated into two parts by @ symbol. a "personal_info" and a domain, that is The length of the personal_info part may be up to 64 characters long and domain name may be up to 253 characters. The personal_info part contains the following ASCII characters. Uppercase (A-Z) and lowercase (a-z) English letters. Digits (0-9). Characters ! # $ % & ' * + - / = ? ^ _ ` { | } ~ Character . (period, dot or fullstop) provided that it is not the first or last character and it will not come one after the other. The domain name [for example com, org, net, in, us, info] part contains letters, digits, hyphens, and dots. Example of valid email id   Example of invalid email id mysite.ourearth.com [@ is not present] [tld (Top Level domain) can not start with dot "."] @you.me.net [No character before @] [".b" is not a valid tld] [tld can not start with dot "."] [an email should not be start with "."] mysite()*@gmail.com [here the regular expression only allows character, digit, underscore, and dash] [double dots are not allowed] JavaScript code to validate an email id function ValidateEmail(mail) { if (/^\w+([\.-]?\w+)*@\w+([\.-]?\w+)*(\.\w{2,3})+$/.test(myForm.emailAddr.value)) { return (true) } alert("You have entered an invalid email address!") return (false) } To get a valid email id we use a regular expression /^[a-zA-Z0-9.!#$%&'*+/=?^_`{|}~-][email protected][a-zA-Z0-9-]+(?:\.[a-zA-Z0-9-]+)*$/. According to ! # $ % & ‘ * + – / = ? ^ ` . { | } ~ characters are legal in the local part of an e-mail address but in the above regular expression those characters are filtered out. You can modify or rewrite the said regular expression. Flowchart : Regular Expression Pattern /^\w+([\.-]?\w+)*@\w+([\.-]?\w+)*(\.\w{2,3})+$/ Let apply the above JavaScript function in an HTML form. HTML Code JavaScript form validation - checking email Input an email and Submit JavaScript Code function ValidateEmail(inputText) { var mailformat = /^\w+([\.-]?\w+)*@\w+([\.-]?\w+)*(\.\w{2,3})+$/; if(inputText.value.match(mailformat)) { alert("Valid email address!"); document.form1.text1.focus(); return true; } else { alert("You have entered an invalid email address!"); document.form1.text1.focus(); return false; } } CSS Code li {list-style-type: none; font-size: 16pt; } .mail { margin: auto; padding-top: 10px; padding-bottom: 10px; width: 400px; background : #D8F1F8; border: 1px soild silver; } .mail h2 { margin-left: 38px; } input { font-size: 20pt; } input:focus, textarea:focus{ background-color: lightyellow; } input submit { font-size: 12pt; } .rq { color: #FF0000; font-size: 10pt; } View the Javascript email validation in the browser RFC 2822 standard email validation Regular Expression Pattern (Ref: : /(?:[a-z0-9!#$%&'*+/=?^_`{|}~-]+(?:\.[a-z0-9!#$%&'*+/=?^_`{|}~-]+)*|"(?:[\x01-\x08\x0b\x0c\x0e-\x1f\x21\x23-\x5b\x5d-\x7f]| \\[\x01-\x09\x0b\x0c\x0e-\x7f])*")@(?:(?:[a-z0-9](?:[a-z0-9-]*[a-z0-9])?\.)+[a-z0-9](?:[a-z0-9-]*[a-z0-9])?| \[(?:(?:25[0-5]|2[0-4][0-9]|[01]?[0-9][0-9]?)\.){3}(?:25[0-5]|2[0-4][0-9]|[01]?[0-9][0-9]?|[a-z0-9-]*[a-z0-9]: (?:[\x01-\x08\x0b\x0c\x0e-\x1f\x21-\x5a\x53-\x7f]|\\[\x01-\x09\x0b\x0c\x0e-\x7f])+)\])/ View the |validation (RFC 2822) in the browser You can use the following email addresses to test the said Regular Expression: Ref: List of Valid Email Addresses List of Strange Valid Email Addresses file_download Download the validation code from here.

Other JavaScript Validation: Previous: JavaScript: HTML Form - restricting the length Next: JavaScript: HTML Form - Date validation Test your Programming skills with w3resource's quiz. add properties to a constructor function Person(firstName, lastName) { this.firstName = firstName; this.lastName = lastName; } const member = new Person('Lydia', 'Hallie'); Person.getFullName = function() { return `${this.firstName} ${this.lastName}`; }; console.log(member.getFullName()); You can't add properties to a constructor like you can with regular objects. If you want to add a feature to all objects at once, you have to use the prototype instead. So in this case, Person.prototype.getFullName = function() { return `${this.firstName} ${this.lastName}`; }; would have made member.getFullName() work. Why is this beneficial? Say that we added this method to the constructor itself. Maybe not every Person instance needed this method. This would waste a lot of memory space, since they would still have that property, which takes of memory space for each instance. Instead, if we only add it to the prototype, we just have it at one spot in memory, yet they all have access to it! Ref: We have verified over 90 million emails in the last year. We can clean your email list too.Try Snov.io Email Verifier for free A valid email address consists of an email prefix and an email domain, both in acceptable formats. The prefix appears to the left of the @ symbol. The domain appears to the right of the @ symbol. For example, in the address example@mail.com, "example" is the email prefix, and "mail.com" is the email domain. Acceptable email prefix formats Allowed characters: letters (a-z), numbers, underscores, periods, and dashes. An underscore, period, or dash must be followed by one or more letter or number. Invalid email prefixes: Valid email prefixes: abc-@mail.com abc-d@mail.com abc..def@mail.com abc.def@mail.com .abc@mail.com abc@mail.com abc#def@mail.com abc_def@mail.com Acceptable email domain formats Allowed characters: letters, numbers, dashes. The last portion of the domain must be at least two characters, for example: .com, .org, .cc Invalid email domains: Valid email domains: abc.def@mail.c abc.def@mail.cc abc.def@mail#archive.com abc.def@mail-archive.com abc.def@mail abc.def@mail.org abc.def@mail..com abc.def@mail.com A simple tool to check whether an email address exists. Email Checker is a nice little tool that helps you find out whether an email address is valid or not, within a second. Email Checker is a simple little tool for verifying an email address. It's free and quite easy to use. Just enter the email address and hit the check button. It tells you whether the email id is real or fake. Sometimes, it’s unable to correctly predict and say unknown because some email providers have put some limits and restrictions or they simply don’t like any verification checks on their mailboxes. How do we verify an email ? First it checks for email address format. Then make sure that domain name is valid. We also check whether it’s a disposable email address or not. In the final step, It extracts the MX records from the domain records and connects to the email server (over SMTP and also simulates sending a message) to make sure the mailbox really exists for that user/address. Some mail servers do not cooperate in the process, in such cases, the result of this email verification tool may not be as accurate as expected. Help us improve this site If you have any suggestion/idea for improving this website or adding new feature or something, feel free to email us. Recent Articles Note : We do not share email address(submitted for validation) with anyone. Sign in to persist favorites & patterns. Click the help icon above for info. Any unsaved changes will be lost. Saved patterns & favorites will be migrated to your account. Checking the validity of your client’s email address is very important for your business. It helps you to identify incorrect IDs and spammers. So, you can keep your mailing list clean with the correct and genuine email addresses. There are different ways to check the validity. The most common way is using an API, like Abstract’s Email Verification and Validation API. It can help you to determine the validity of the email address quickly. In this post, you will find all the details.Real customers start with real email IDs. They enable you to reach genuine clients effectively. You don’t want to send emails to fake email IDs. It will lead to high bounce rates. As a result, your sender reputation will be damaged. Ultimately, your emails will end up in the junk folder of the recipient. They will never be opened. So, your emails will have a very low open rate. You never want it to happen. Also, you don’t want to see spammers using fake IDs to sign up on your site. It will make your marketing campaign fail miserably.You can solve all these issues by validating email addresses.It will help you to eliminate the fake email IDs from your mailing list. So, you don’t have to worry about high bounce rates and sender reputation damage. Also, it will prevent spammers from getting into your mailing list. Checklist for a Valid Email AddressSyntax Email ValidationA valid email address has four parts. They are:Recipient name: It represents an email mailbox that belongs to a person. It can also belong to an organization or a department within a company. The recipient name can be up to 64 characters long. It may consist of uppercase and lowercase letters in English (A-Z, a-z). Also, it can have digits from 0 to 9, and special characters, such as: ! # $ % & ' * + - / = ? ^ _ ` { | .@ symbol: It is used to separate the recipient name from the domain name.Domain name: It defines a space on the internet owned by a specific mailbox provider, like Gmail and Yahoo Mail. It can be up to 253 characters long. It may consist of uppercase and lowercase letters in English (A-Z, a-z), digits from 0 to 9, a hyphen (-), and a period (.).Top-level domain: It is the highest level of the domain name system for the internet. It is placed after the domain name in an email address. Common top-level domains are: .com, .net, and .org.Now, let’s take a look at the syntax practically by analyzing different parts of this email address: johndoe52@gmail.comJohndoe52: It’s the name of the recipient.@: This is the symbol that you find in every email ID. It helps you to separate the recipient name from the domain name.gmail: Is the domain name..com: This is the top-level domain.Acceptable Email Prefix FormatsA valid email address consists of an email prefix and an email domain. The prefix appears to the left of the @ symbol. On the other hand, the domain appears to the right. Both of them need to have acceptable formats.Invalid email prefixes:abc-@mail.comabc..def@mail.com.abc@mail.comabc#def@mail.comValid email prefixes:abc-d@mail.comabc.def@mail.comabc@mail.comabc_def@mail.comAcceptable Email Domain FormatsThe email domain may have letters, numbers, and dashes. The last portion must have at least two characters, like .com, .org, .cc, etc.Invalid email domains:abc.def@mail.cabc.def@mail#archive.comabc.def@mailabc.def@mail..comValid email domains:abc.def@mail.ccabc.def@mail-archive.comabc.def@mail.orgabc.def@mail.comRegular Expression Example To Validate Email Address StringThe valid email address comes with a @ symbol. There must be some preceding and proceeding strings. The proceeding strings need to have a dot (.), followed by an additional 2-3 characters. Overall, a valid email address string format looks like this: (randomString1)@(randomString2).(2-3 characters) With that in mind, you can create a Regular Expression to validate an email address string effectively. It looks like this: [a-z0-9]+@[a-z]+\.[a-z]{2,3} How about using this Regular Expression in JavaScript to perform the validation? Let’s try with this code: let regex = new RegExp('[a-z0-9]+@[a-z]+\.[a-z]{2,3}'); let testEmails = ["notanemail.com", "workingexample@email.com", "another_working@somethingelse.org", "notworking@1.com"]; testEmails.forEach((address) => { console.log(regex.test(address)) }); You will get this output:As you can see, the first and fourth email IDs are invalid. However, the second and third addresses are valid.Will it always work? No, some malformed email IDs will still manage to pass through the specified condition. Also, you cannot perform spam detection with Regular Expression. You need to look for an alternative solution to validate email addresses with enhanced efficiency and advanced technologies.Check for Disposable EmailsDisposable email is a service that allows users to receive emails at a temporary address. The address automatically expires after a certain time. The service is widely abused by spammers around the world. They use it to make fake sign-ups at your website and perform fraudulent activities. So, you need to identify and eliminate disposable emails effectively.How can you get rid of disposable emails? You can think about disallowing signups from established disposable email address domains. However, it will not be an easy task. There are dozens of existing domains, with more being added regularly. It will be very difficult for you to track all of them. You can also think about performing periodic audits to check the delivery status of your emails. However, you will be exhausted doing it regularly. You don’t want to check the delivery status of hundreds of emails manually.Is there any easy way to check for disposable emails easily? By utilizing an email address validation API, you can eliminate the disposable emails from your database effortlessly. You just need to make an API request by passing the access key and the email IDs. The API will detect the disposable email addresses instantly.You can use Abstract’s Email Address Validation & Verification API to identify disposable emails in your mail listing easily. Try it now for free.DNS LookupDNS Lookup is the process of finding detailed information about a specified domain name. It enables you to identify important data, like domain availability, IP addresses, expiration date, registration/creation date, owner of the domain, etc.To perform the DNS lookup, simply open your console app and run this command: nslookup johndoe23452@mailinator.com You will get this result: *** Unknown can't find johndoe23452@mailinator.com: Non-existent domain Methods to Ensure You Receive a Valid Email 100% of the TimeAn APIAnother great way of validating emails is using an API. It can make the entire process very simple. You can use it to verify the IDs in just a few seconds.You can try using Abstract’s Email Validation and Verification API. It is lightweight and super-fast. It allows you to validate email addresses easily and quickly. Abstract’s Email Validation and Verification API enables you to validate email strings effortlessly. Try it now for free.Let’s verify this email address with Abstract’s Email Validation and Verification API: johnsmith@gmail.comLet’s make an API request: If the request is successful, you will get this JSON response: { "email": "johnsmith@gmail.com", "autocorrect": "", "is_valid_format": true, "is_free_email": true, "is_disposable_email": false, "is_role_email": false, "is_catchall_email": false, "is_mx_found": true, "is_smtp_valid": true, "quality_score": 0.99, } Notice that "is_valid_format" is set to true. That means the given email address is valid. Also, you get a variety of useful data, like quality score, email role, SMTP validation, etc. By using this information, you can determine the validity of the email IDs effectively and effortlessly.Read: Top 5 Free Email Validation APIsSending Your Users an EmailHow about sending an email to the users and requesting a return receipt? It will help you to find whether the email has been delivered or not. However, there are some limitations. Not all email address providers support the return receipt feature. Also, a recipient can opt-out of sending a return receipt. So, there's no guarantee of getting it. If you are using Microsoft Outlook, you can request separate return receipts for the delivery and opening of your email. If you are using Gmail, you can request the return receipt for only the opening of your email. There’s no additional receipt for delivery. Also, you need to have a Google Workspace administrator account. Free Gmail accounts do not support the feature. You can find the steps of getting return receipts in both Microsoft Outlook and Gmail right here.Recommended ContentEmail validation FAQsHow Do You Set Up Email Validation?You can easily set up email validation by using APIs, like Abstract’s Email Validation and Verification API. It enables you to find genuine email IDs effortlessly. All you have to do is make an API request with the access key and email addresses. You will get the IDs validated instantly.What Is An Email Validation?Email validation is the process of verifying an email address to determine its deliverability and validity. It involves utilizing various methods, like syntax check, typo check, SMTP verification, etc. It helps you to find and eliminate fake email IDs effortlessly. So, you can keep your mailing list clean with genuine email addresses.What Is An Unverified Sender?An unverified sender is a feature of Office 365. It enables you to identify potential spam or phishing emails in your inbox. When the feature detects a suspicious email, it displays a question mark in place of the sender’s avatar or contact initials. So, you can detect potential phishing attacks quickly.
