How to set tyrolia bindings

Here's link to the tech manual - it was the second line on a google search www.tyrolia.com/fileadmin/pdfs/2011.../rental_man_201112_en.pdf That binding, like many rental bindings, is pretty loose on the rail, especially if it's actually been on rental skis. Mount bindings to boot length(ish), check that the AFD's will slide freely, set forward pressure & set dins. you can't do anything if there's play between the bindings & the rail. If there's play between the boot & the bindings then the most likely cause with old boots is worn toe &/or heel lugs. If there's wear to the lugs get new/replacement ones from CEM at Solutions4Feet. Get the binding torque tested. Because the alpine ski bindings connect your boots to your skis, choosing the right pair is essential in putting together the ski set. There are two main things to consider when selecting alpine ski bindings. The maximum din setting you need and the width of the ski you plan on using. To reduce the risk of injury, Alpine ski bindings are designed to release your boot in the event of a crash. A bindings din setting is the indication of how easily the boot release from the binding. The higher the din setting is, the greater the amount of force required to initiate the release from feet. You want to consider your weight and ability to determine the correct din setting for you. Generally, the heavier and more advanced skier will require a higher DIN setting. Well lighter and less experienced skiers will benefit from a lower din setting. Alpine ski bindings selection You also want to consider the underfoot width of the ski you plan on mounting the binding to. The wider the ski is, the wider the binding break will need to be. Most bindings manufacturers offer several different break widths to accommodate different sizes of skis. And remember, it's always a good idea to have your bindings mounted, adjusted, and serviced by a certified ski binding technician. Ski binding DIN settings chart Release Force Setting (DIN), short for Deutsches Institut für Normung (German Institute for Standardization), is the industry-adopted scale of release force settings for ski bindings. The DIN setting is calculated based on your boot sole length, age, weight, height, and ability level when your bindings are mounted on your skis. The higher the DIN, the higher the force required to release from your bindings. See the DIN chart below. DIN settings chart shopShop our wide selection of frame and tech alpine touring bindings from Marker, Salomon, Atomic, Tyrolia, Dynafit, G3, Fritschi and more! I've only skied 2 times so far. I am hoping someone can help me with two things:I adjusted the bindings to fit my boot, but when I lock in the boot, the front binding "flares" out a little as you can see in the pics. Is this normal or should I slide the binding out a little more so that when the boot locks, it doesn't do that to the front binding?Using the manufacturer's manual, I was able to figure out the DIN for me and the boot length I am using. the bindings were set at 6 exactly. My DIN is 5.5 so I changed it on the front bindings, but I can't figure out what tool I need to change it in the back.Here's the relevant pics. Edit. Scratch question 2. I used a flat head screwdriver and turned the plastic on the back binding, was able to change the DIN. Question 1 still remains!Page 2 9 comments Before you can go skiing, you first need skis. Those skis then need a binding. And very importantly: the binding needs to be adjusted correctly and individually. Do you have to see a professional about this every time? Can you adjust the ski binding yourself? How do you adjust a ski binding? What is a DIN setting and how is it calculated? Snow-Online has the answers to all of your questions.Our Snow-Online DIN Setting Calculator helps you find the right DIN setting for your ski binding. Just fill in your bodyweight, boot sole length (in millimetres; usually engraved or printed on the outside of your boot's heel), skiing ability level, and age, and the calculator gives you the appropriate DIN setting:-- First things first: you don't have to see a professional every time you want to adjust your ski binding. A little knowledge about the function of a ski binding provided, you can easily adjust it yourself. What you need to understand is how the binding works, which DIN setting you need, and how to calculate it.A ski binding has two main functions: on the one hand, it needs to fix the ski boot (and hence the skier) to the ski. On the other, the binding needs to release under force or when you fall, and separate the boot from the ski in time to keep the skier from being injured.Complex mechanics help to manage this balancing act. Not only do they have to function impeccably, they absolutely need to be adjusted correctly and individually. According to a skier's bodyweight, boot sole length, age, and skiing ability, the release force setting, or DIN setting, determines when a binding releases.The DIN setting is the release force setting of a ski binding. It is the value that determines the amount of force effect needed for a binding to release in order to keep the skier from being injured. There are two officially approved methods to determine this DIN value:The tibia method is mainly applied by professionals in Germany. With this method, the expert measures the width of the tibial plateau at you knee. Most frequently used all over the world, however, is the bodyweight method. It was developed in the USA and Switzerland, and is based on scientific analyses of skiing accidents.According to bodyweight, boot sole length, skiing ability, and age, the weight method uses a table to determine the DIN setting. The higher the DIN setting, the later the binding releases, and the higher the risk of injury!To find the right DIN setting for a person using the bodyweight method, you first need the weight, sole length, ability level, and age of the person whose ski binding you want to adjust. Then you have to read the table correctly. Follow these five steps:First you want to find the line with your bodyweight inside of the DIN setting table.Then you look right to find the base DIN setting according to your sole length.Now is where the ability level comes in. We distinguish three different types of skiers:Type 1: Beginners and cautious skiers who ski mainly on even to relatively even slopes with slow to medium speed.Type 2: Intermediate skiers who ski mainly on relatively even to relatively steep slopes with higher speed.Type 3: Very experienced skiers who ski mainly on relatively steep to steep slopes with high speed and pressure on the edges and in an aggressive manner.Now you can determine your DIN setting according to the skiing ability:Type 1: The base DIN setting is the correct setting.Type 2: The DIN setting one line below the base setting is correct.Type 3: The DIN setting two lines below the base setting is correct.As a last step you can adjust the setting according to age: skiers under 10 or over 50 years old should move one line up to find the right DIN setting.Weight in kgDIN Setting in relation to the sole length (in mm) of your ski boot–250251 – 270271 – 290291 – 310311 – 330330+10 – 130,750,75 14 – 171,001,000,75 18 – 211,501,251,00 22 – 251,751,501,501,25 26 – 302,252,001,751,501,50 31 – 352,752,502,252,001,751,7536 – 413,503,002,752,502,252,0042 – 48 3,503,003,002,752,5049 – 57 4,504,003,503,503,0058 – 66 5,505,004,504,003,5067 – 78 6,506,005,505,004,5079 – 94 7,507,006,506,005,5095+ 8,508,007,006,50 10,009,508,508,00 11,5011,0010,009,50As explained above, complex mechanics are responsible for the ski binding to fix the boot to the ski or release in time when the skier falls or force is applied, in order to prevent major injuries.The ski binding is an important safety device. Whenever you adjust your ski binding yourself, you should thus be sure of what you're doing, and aware of the possible consequences of a DIN setting too high or too low.If this is not the case, better keep your hands off the binding and see a professional!No responsibility is taken for DIN values calculated with the DIN Setting Calculator. No responsibility is taken for the DIN values in the DIN setting tables. TouriSpo GmbH & Co. KG as operator of Snow-Online assumes no liability.
