Beyond this border there is the hidden hidden hemisphere of Uranus, which at the moment remains completely dark while the planet rotates. The blue-green color derives from the absorption of red light by the methane gas in the deep, cold and extraordinarily clear atmosphere of Uranus. The Ã, Ã, Ã, Ã, QUIC KÃ, Ã, Ã, Ã, Brown Ã, Ã, Ã, fo xÃ, Ã, Ã, Ã, Ã, ã, fo xÃÃ, Ã, Ã, Ã, Ã, Ã , Ã, Ã, Ã, Ã, Ã, Ã, Ã, Ã, ã, Ã, Ã, ã, ã, Ã, is chosen from the 26 colors people can distinguish the difference in shades, saturation and value (brightness) of over one million Chromatic combinations (Halsey and Chapanis, 1951; Kaiser and Boynton, 1989) When the colors are compared alongside the side in an optimal way. Lighting conditions. That being said, the memory of colors in people is not very good, nor is the ability to discriminate between specific colors that are also remotely similar when separated from time. In this situation the number of easily identifiable colors drops to twelve. This could be due to a series of factors, such as the increase in light necessary to accurately see the colors, the fact that, due to our biological composition, the color tends to change in an object due to the interaction With other colors in the vicinity of the color observed or the color of the light used to see the object in question, and perhaps because we do not use the color consistently where precision is necessary. In our daily life. We tend to use qualifiers (darker, lighter, -ish, etc.) to describe color differences instead of giving individual names to colors. (See Munsell Color System.) The work done at the end of the 60 ™ 60s on the theory of the evolution of colors shows that there are regularity naming colours in many different languages, as well as the order in which these terms are introduced into culture over time, with black and white as the first colours to appear in a language (f (f The language has specific words for colors), followed by red, then green and / or yellow, blue and finally the colors purple, pink, orange and brown. All other colors are considered by most speakers of that language to be variants of these basic color terms. All languages today that have color terms are considered between two and twelve terms with English reaching eleven color conditions (basic color terms: their universality and evolution Brent Berlin and Paul Kay, 1969). The work done by Colin Ware (building on the work done by Kay and others) and his work on perception, has produced the maximum set of twelve colors that can be accurately differentiated from people with standard vision without errors. These colors (shown below) are: 1. Red, two. Green, 3. Yellow, 4. Blue, 5. Black, 6. White, 7. Rosa, 8. Cyan, 9. Grey, 10. Orange, 11. Brown, 12. violet. These colors are the most easily identifiable colors based on perceptual research and can be used to encode data with a high degree of decoding accuracy in humans who do not experience color blindness. The 12 colors above were then taken by me as a starting point from which to extract a larger set of colors to assign a color to each letter in the alphabet. Choosing colors Started by removing the white color from the color set to be used as a background color (for printing on white paper) which left a set of 11 colors to work with. After analyzing the frequency chart for the letters as they occurred in English (letter frequency) I noticed a trend that vowels all presented at the top half of the chart (with 4 of them making the top 5). I decided to make them more distinct by mapping the most saturated primary/secondary colors into the following chord: A = blue, e = orange, i = yellow, o = red, and u = green. The next set of high frequency letters were mapped with the colors: t = cyan, s = purple, l = pink and h = grey. I noticed that variations in the colors at this point with pink having two possible shades of salmon and pink, the same for violet, grey and cyan. The remaining letters have been mapped with colors that differed in shade, hue and saturation to the above set: these values will then be mapped to a set of Pantone and CIE patches for use in direct reflective printing to ensure print accuracy. < (Letter) (R, G, B) (A *) (0, 0, 180) Blue (B *) (175, 13, 102) Violet (c *) (146,248,70) Yellow-yellow (D *) (255, 200, 47) Yellow-orange (E *) (255,118,0) Orange (F *) (185,185,185) Light grey (G *) (235.235,222) OFF-WHITE (H *) (100,100,100) Grey (I *) (255.255.0) Yellow (J *) (55,19,112) Dark purple (K *) (255.255.150) Light yellow (L *) (202.62.94) Dark Pink (M *) (205.145.63) (N*) (12,75.100) Teal (O*) (255,0,0) red (P*) (175,155,50) dark yellow (Q*) (0,0,0) Black (R*) (37,70,25) Dark-Green (S*) (121,33,135) Purple (T*) (83.140,208) Light-Blue (U*) (0,154,37) Green (VDark blue (Y *) (175,200,74) Olivastro green (Z *) (63.25,12) Red-brown -> ->
