The history of physical science explains how some of the main concepts of physics have been discovered. Take a look at these articles on the history of physics. Water covers most of the planet, and the water bodies of the world provide a field of study for many related scientific disciplines. Limnologists and oceanographers, marine biologists and marine geologists study various aspects of the oceans. Physical oceanographers are specialized in the study of oceans and physical aspects of their circulation. This includes everything, from the study of world currents to the effect of local tides on the coast. Most physical oceanographers spend several years earning graduates in their field. Careers in physical oceanography begins with a degree. Many schools offer university programs in physical oceanography or oceanography programs with the option of a physical physical emphasis. However, physical oceanography is intrinsically multi-disciplinary, so students can choose other majors and still find career later in the field. Core subjects in the curriculum should include physics, general oceanography, geology, chemistry and biochemistry and advanced mathematics. Computer programming and modeling capacities are also vital for physical oceanography and make a useful or minor intention as part of your degree program. Although it is possible to work in oceanography with a degree, responsible and well-paid positions typically require a degree. Oceanographers with the degrees of the teacher can work in most government and private sector settings, as well as for non-governmental associations. Create and administer research projects or academic positions with university and important research structures, generally requires a doctorate. Graduates typically require two to four years to be completed. Oceanographers with highly specialized interests and areas could also complete post-graduate certification programs to improve their intellectual or academic position. The education of a physical oceanographer can request from six to 10 years, but opens the door to a wide range of career paths. Investigations on the ocean currents of the world and the navigable ways have far-reaching implications for commercial shipping, fishing and naval activities. The interaction of the oceans and the atmosphere, another aspect of physical oceanography, plays a role in the forecast of time and which provides for the appearance and course of the main storms. Physical oceanographers recommend governmental and non-governmental organizations on the effects of coastal erosion, and help to predict the effects of new infrastructure construction projects and tidal action. The Bureau of Labor Statistics projects 21 percent growth in the number of geologists, a group that includes oceanographers, between 2010 and 2020. The BLS provides reduced recruitment in the public sector due to budget constraints, but an increase in the number of scientists working as or for private research contractors. Physical oceanography also has a role to play in environmental regulation and resource management, areas in which BLS provides for strong growth. The geoscientists have gained an annual median salary of $ 89.780 in 2016, according to u.s. Bureau of Labor Statistics. On low end, geologists gained a 25th percentile salary of $ 62.830, which means 75 percent earned more than this amount. The 75 Â ° Percentile salary is $ 127.620, the meaning of 25% earn more. In 2016, 32,000 people were employed in the U.S. As geoscientists. Photo courtesy: Alexis Brown / Unsplash test-test is never fun, but something everyone has to face in life. However, it can be even less fun and more When you do not have effective study habits. You can change that today, however, with these intelligent research-based study suggestions that takes into account the biological, psychological, emotional and physical realities of human being. Putting some or all these suggestions in practice, you See Drastic improvements in study sessions and test scores. Have you ever noticed that when you go to sleep worried or stressed, tend to not sleep well? This is because your brain continues to work even while your body is resting. Use this to your advantage. Photo Cortesy: Dejan Krsmanovic / Flickr do some study when you are sleepy so that your brain can process the information while you do ... try to avoid bringing your materials in the bed, though. Your brain must be able to associate your bed the bed, and confusing the two could give you insomnia. Have you ever woken up and something that was confused the day before was suddenly crystalline? This happens because your brain can create more clear connections when it is not distracted. The good news is that you can take advantage of this capacity for your advantage. Photo of courtesy: Jonathan Grado / Flickr Register to read the facts you want to memorize. When you go to bed, reproduce them. Set the recording to a cycle so that you will repeat until you wake up. As you listen to repeated information, plants from your brain. Everyone knows that physical exercise can improve health, help a person lose weight and tone the body. It can increase a person's mood, improve their self-esteem, free your mind and reduce stress. However, did you know that it can also improve your cognitive function? Photo courtesy: 70023VENS2009 / Flickr Only one half an hour of your Heart Pumping can improve the speed when your brain processes information. Go for a run, the speed walks around your neighborhood, make a training DVD, hit the gym or dance around your room a little before starting to study for a further boost. The flashcards have been around for years, and with good reason Ã ¢ â,¬ "they work. They require you to interact with the information contrary to read it only from a book or a piece of paper. If you use them repetitive, your brain Quickly link the question with the answer. Photo Cortesy: Jonathan Trumbull / Flickr To use this method, buy a notecard package. Put a question or a vocabulary on one side and the answer or definition from the other. Quiz yourself with these Cards regularly until you are sure in answers. Listen and see something are good ways to store information in your brain. When you put together the two methods in order to see something and listen at the same time, increases the possibility of remembering exponentially . Photo of courtesy: Simon James / Flickr tries to read aloud from your study materials to increase your learning experience. Of course, you feel embarrassing, and you certainly don't want f Arlo in public, but payroll in better retention, and can also be used to capture errors in written positions. The non-stop study can seem a good way to prepare for a test, but actually be the opposite. Just like your body needs time to rest, so waiting for you. You should take a break during your study sessions every hour at an hour and a half. Get up, move, lengthen or simply relax. Photo courtesy: UBC Learning Commons / Flickr Plan Breaks Breaks, also Ã ¢ â,¬ "up to a day or two every week. Listen to friends, take a business without a brain, or read a book that has nothing To do with the school. Your brain will thank you for giving it the time needed to process. Music can do extraordinary things to your brain. Listen Activate memory and language centers and was found to improve the ability of one person to learn. If you turn on a background music during the studio, improves your chances to understand and store information. Photo of courtesy: Nikolai Kashirin / Flickr While there is no music to listen, it can be difficult to pay attention to books when your favorite music is active. Try to choose something that is not the distraction - classic is, well, a classic. It is always important to get a full night's sleep, but especially so when the test time is close. Studying all night can seem better choice for What you need to know, but the brain tends not to work so well without sleeping. Photo of courtesy: Planetchopstick / Flickr is difficult for your brain to call up all this information you worked so hard to remember when digging through mental fog. Furthermore, lack of sleep causes bad mood and leaves you more susceptible to stress and disease - none of which is necessary when trying to pass a test. Take some time to change your study environment. Clear any disorder, since it can be distracted and download your mental energy. Make sure you have good lighting and any supply you may need to close. Photo Cortesy: Matt Biddulph / Flickr also uses a smell to your advantage. The scent of lavender has a calming effect on people, so try a candle or a lavender oil when studies. It can reduce stress and improve memory. Also, consider keeping some bright colors. Colors as orange and yellow can help stimulate brain. It is incredibly difficult to study when the phone continues to shoot or make a facebook notification. When it is time for a study session, turn off the phone and all notifications on it. You can let the family and friends know that you will not be available during study time, so nobody worries. Photo courtesy: Andrew Mantarro / Nobody can be necessary sometimes to use the Internet for the studio, but can be extremely distracted. Try to ensure that the only tables you have opened are those relevant to your studio. Yoga is not just good for the body, but it is also excellent for the brain. When you practice yoga, your brain is loaded with gamma-aminobutic acid (GABA), which is a chemical that improves your mood and decreases anxiety. Dopamine and serotonin are both chemicals, and increase when the stress hormone cortisol decreases. Photo courtesy: Goran has / flickr Furthermore, studies show that the brain parts grow actually in size thanks to yoga. It also promotes cortical bending, which helps to process information and keep your memory memory. Meditation has similar positive effects on the brain to yoga. Meditating even a few minutes before studying, you should experience a boost in attention and an anxiety reduction. Photo of courtesy: Isabell Winter / Flickr Before jumping into your studies or a test, take some moments to meditate. You could close your eyes and view a quiet place or simply work to let your thoughts go for a moment. You will encounter your nerves and should help your brain store and recall information better. One of the worst things you can do to yourself is waiting until the night before a test to start studying. Compared to the study in smaller time than a week's time or month in advance, stimulate everything in the last second is not effective. Photo of courtesy: Quinn Dombrowski / Flickr If you are in college or even high school, it is likely that you have received a program and program at the beginning of the class. Use it to your advantage. Start studying how you can possibly be able to do little by little instead of everyone at once. Have you ever sit to study and simply had no idea where to start? Maybe you started studying thinking that it would only be an hour or so just to find the rising sun. Some people even study to the detriment of other things that should be priority. Photo of courtesy: RenÃƒâta-Adrienn / Flickr If any of this sounds like you, try creating a study program to keep you organized. Choose the times and days when studies in advance to discipline In study mode Ã ¢ â,¬ "and then leaving it when it is time to move forward. Trying to read and store three new chapters of the information and conference notes in a single session is not an effective study method . Instead, you should break the information in smaller and more manageable blocks. Photo courtesy: Amy / Flickr for example, you could just try to study three sections of a chapter at a time before moving to the next. If you have 30 definitions you have to memorize , test test Only five by heart at a time. Breaking things in smaller portions is much less stressful and more effective than trying to remember everything at once. The tomato technique has been around since the 1980s, but it was adapted to adapt people and situations different over time. The basic idea is to focus on a task for 25 minutes, take a 3-5 minute break, and then take another 25 minute tomato. After four tomatoes, take a break from 15 to 30 minutes. Photos Courtesy: Gerlos / Flickr You can use this method for the study as well. By setting a rhythm for the study session, make it easier to study longer even when you give your brain the pauses you need to effectively maintain information. It doesn't matter if youÃ ¢ king eight or 80, everyone loves a prize, and you can use this fact to your advantage. With creating a reward system, youÃ ¢ ll more motivated â €
